# VICROADS FOAM BITUMEN INVESTIGATION WORKSHOP

# **PRELIMINARY DESKTOP**

# **STUDY – THINGS WHICH**

# **SHOULD BE INCLUDED**

## **PRELIMINARY DESKTOP STUDY – THINGS WHICH SHOULD BE INCLUDED**

**PAVEMENT NEEDS ?**

**ARE THERE ANY CONSTRAINTS?**

**i.e. Fixed Level, Underground Services, Construction under Traffic Etc.**

**ESTIMATED ALLOWANCE \$\$ ?**

**CURRENT MAINTENANCE REQUIREMENTS?**

**IMPORTANCE OF THE ROAD (HIERARCHY)?**

**LIKELY FOUNDATION SOIL (geology maps)?**

**TRAFFIC LOADING (traffic study information)?**

**PREVIOUS TREATMENTS THAT HAVE SUCESSFULLY WORKED IN THE AREA?**

## PRELIMINARY DESKTOP STUDY – THINGS WHICH SHOULD BE INCLUDED

**IMPORTANCE OF THE ROAD (HIERARCHY)?**

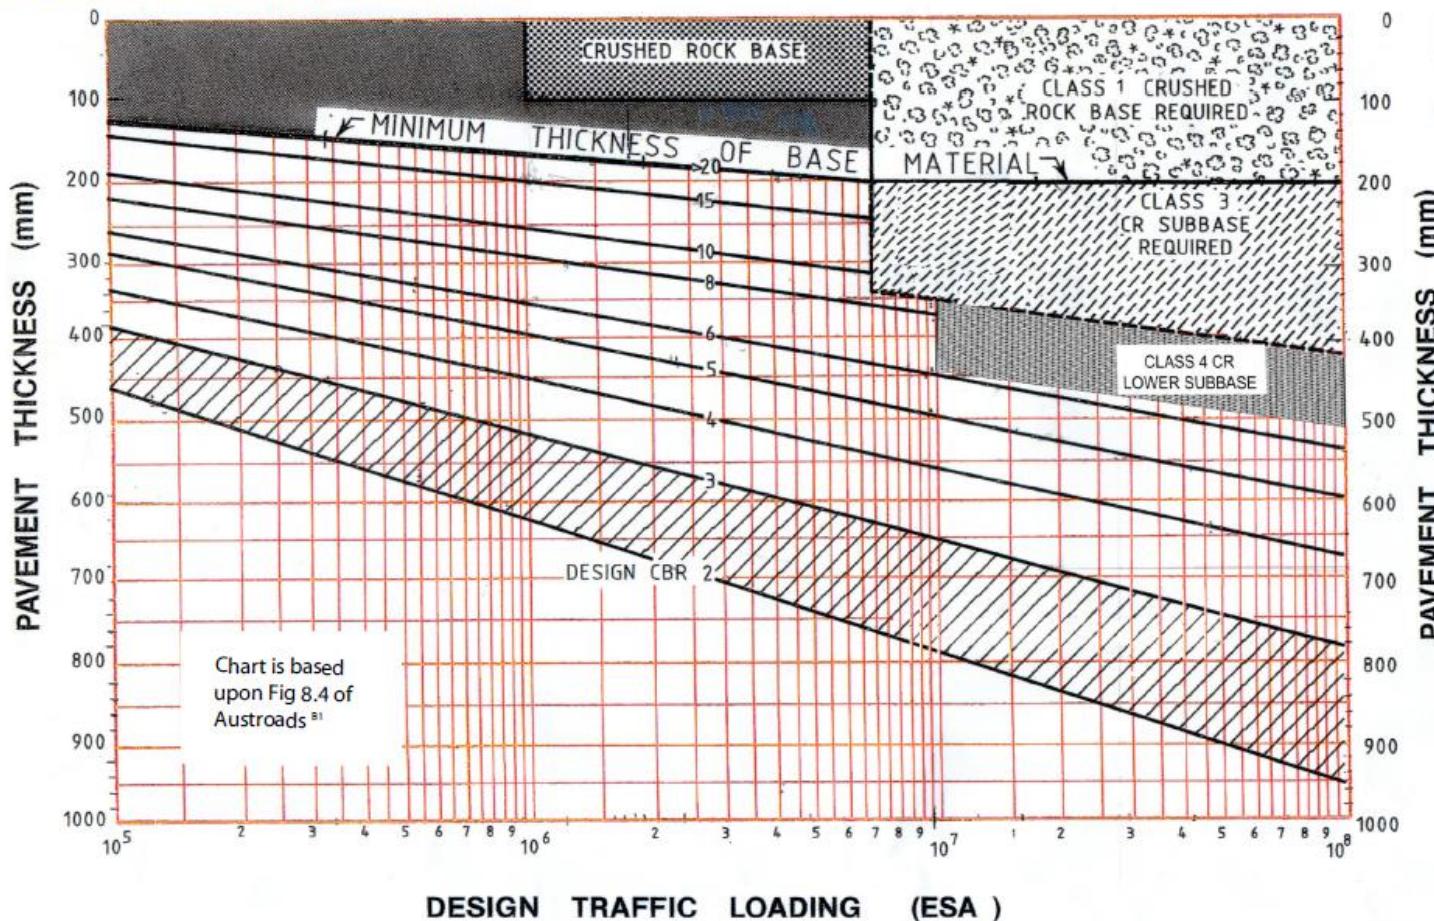

**TRAFFIC LOADING (traffic study information)**

**LIKELY FOUNDATION SOIL (geology maps)?**

| Street Type  | Range of Computed ESA           |
|--------------|---------------------------------|
| Minor        | $2 \times 10^3 - 6 \times 10^4$ |
| Local Access | $3 \times 10^3 - 3 \times 10^5$ |
| Collector    | $6 \times 10^4 - 2 \times 10^6$ |
| Distributor  | above $3 \times 10^5$           |

Appendix F

Design Chart For Unbound Flexible Pavements

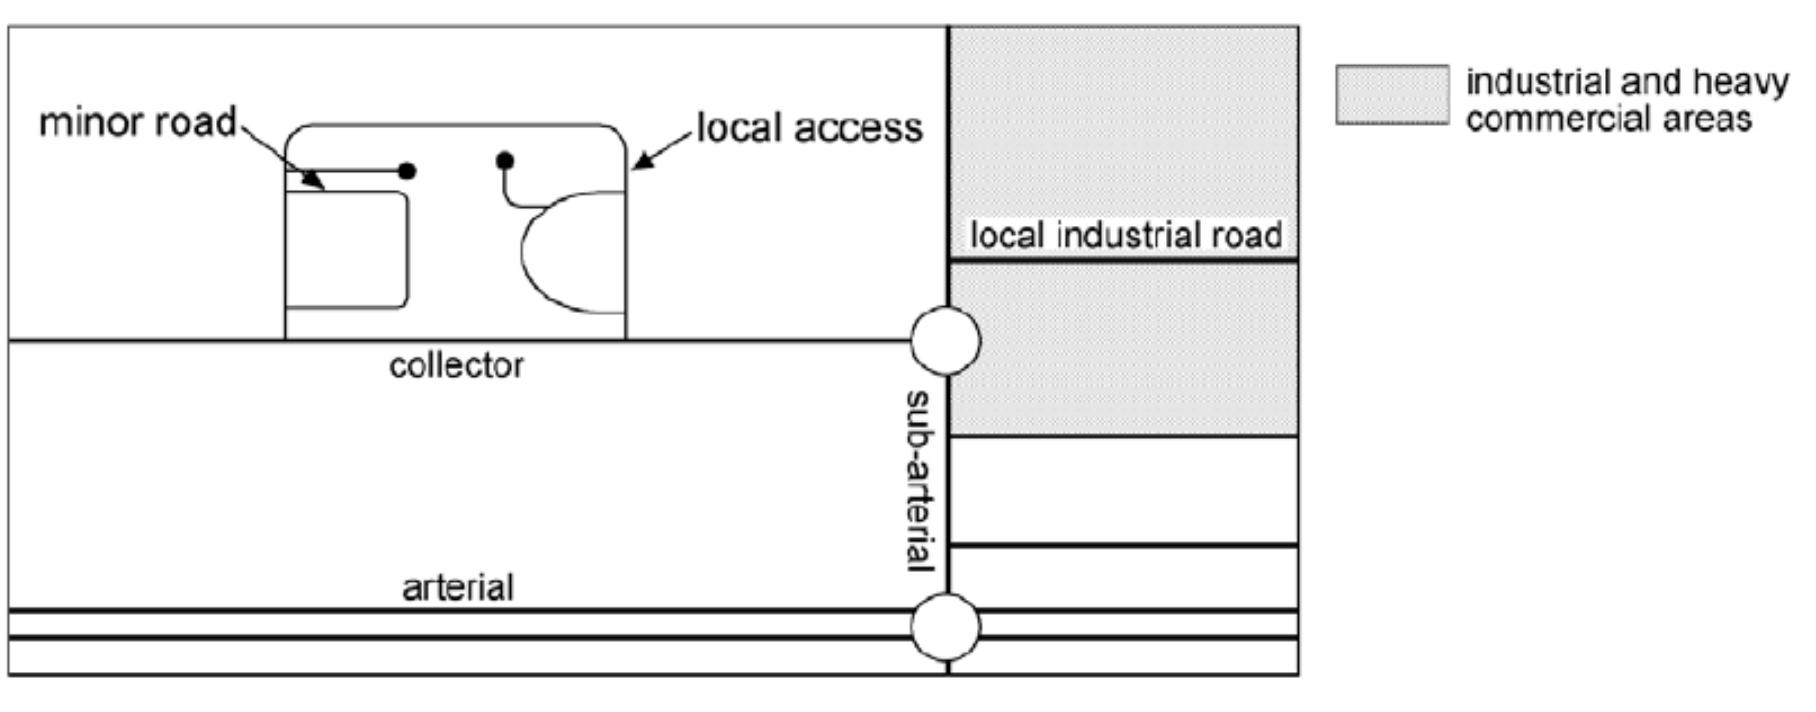

## PRELIMINARY DESKTOP STUDY – THINGS WHICH SHOULD BE INCLUDED

# SITE INVESTIGATION

## VISUAL SITE ASSESSMENT

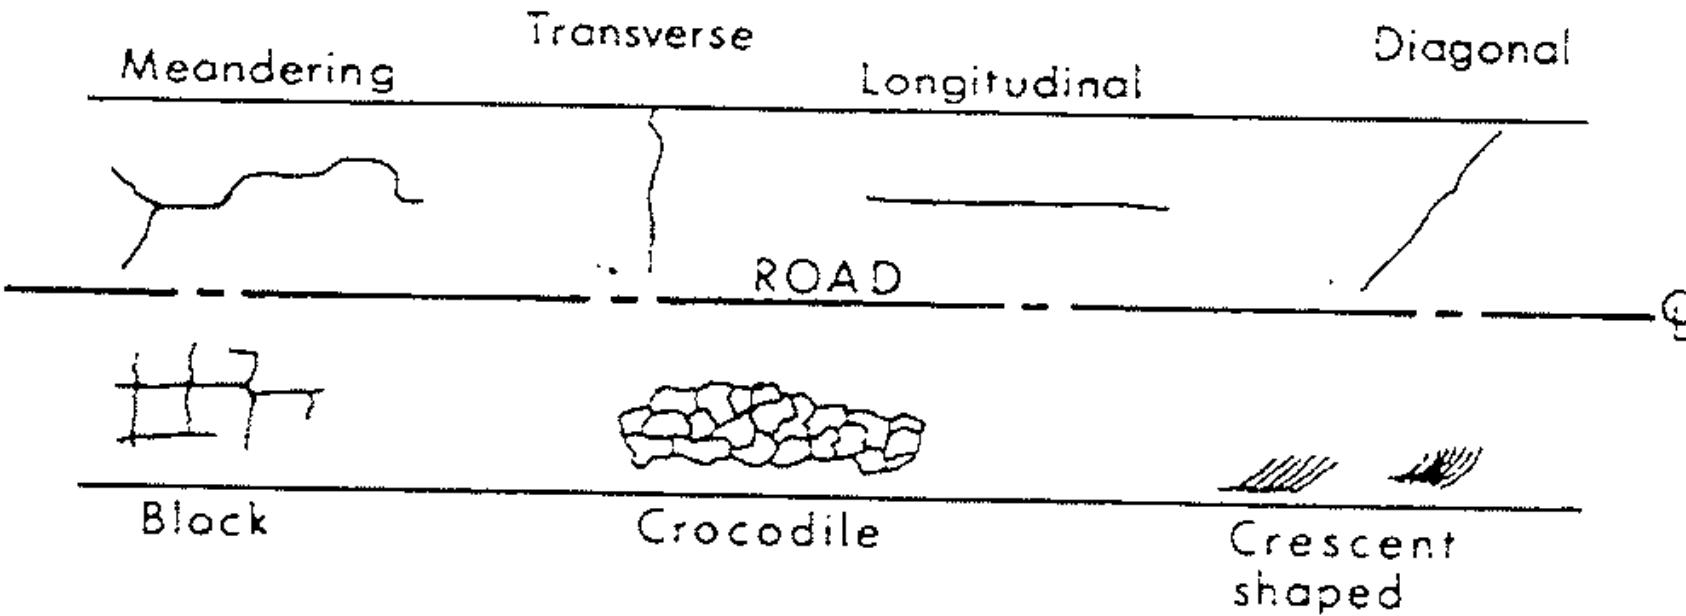

# SITE INVESTIGATION

## VISUAL SITE ASSESSMENT

# SITE INVESTIGATION

## VISUAL SITE ASSESSMENT

# SITE INVESTIGATION

# VISUAL SITE ASSESSMENT

## Crocodile Cracking

Crocodile cracking is likely associated with a fatigued pavement, inadequate pavement thickness or material and / or a brittle or aged bitumen

# SITE INVESTIGATION

# VISUAL SITE ASSESSMENT

## Minor/ major patching treatments

Various patches are likely associated with routine maintenance of developing defects over the years and associated upgrading.

# SITE INVESTIGATION

## VISUAL SITE ASSESSMENT

### Block Cracking

Block Cracks are commonly associated with cemented materials, likely caused by shrinkage or fatigue cracking of a underlying bound layer with reflective cracking eventually coming up through to the surfacing.

# SITE INVESTIGATION

# VISUAL SITE ASSESSMENT

## Meandering cracking

Meandering cracking observed is likely associated differential moisture conditions or settlement within filled areas.

# SITE INVESTIGATION

## VISUAL SITE ASSESSMENT

### Longitudinal and Transverse cracking

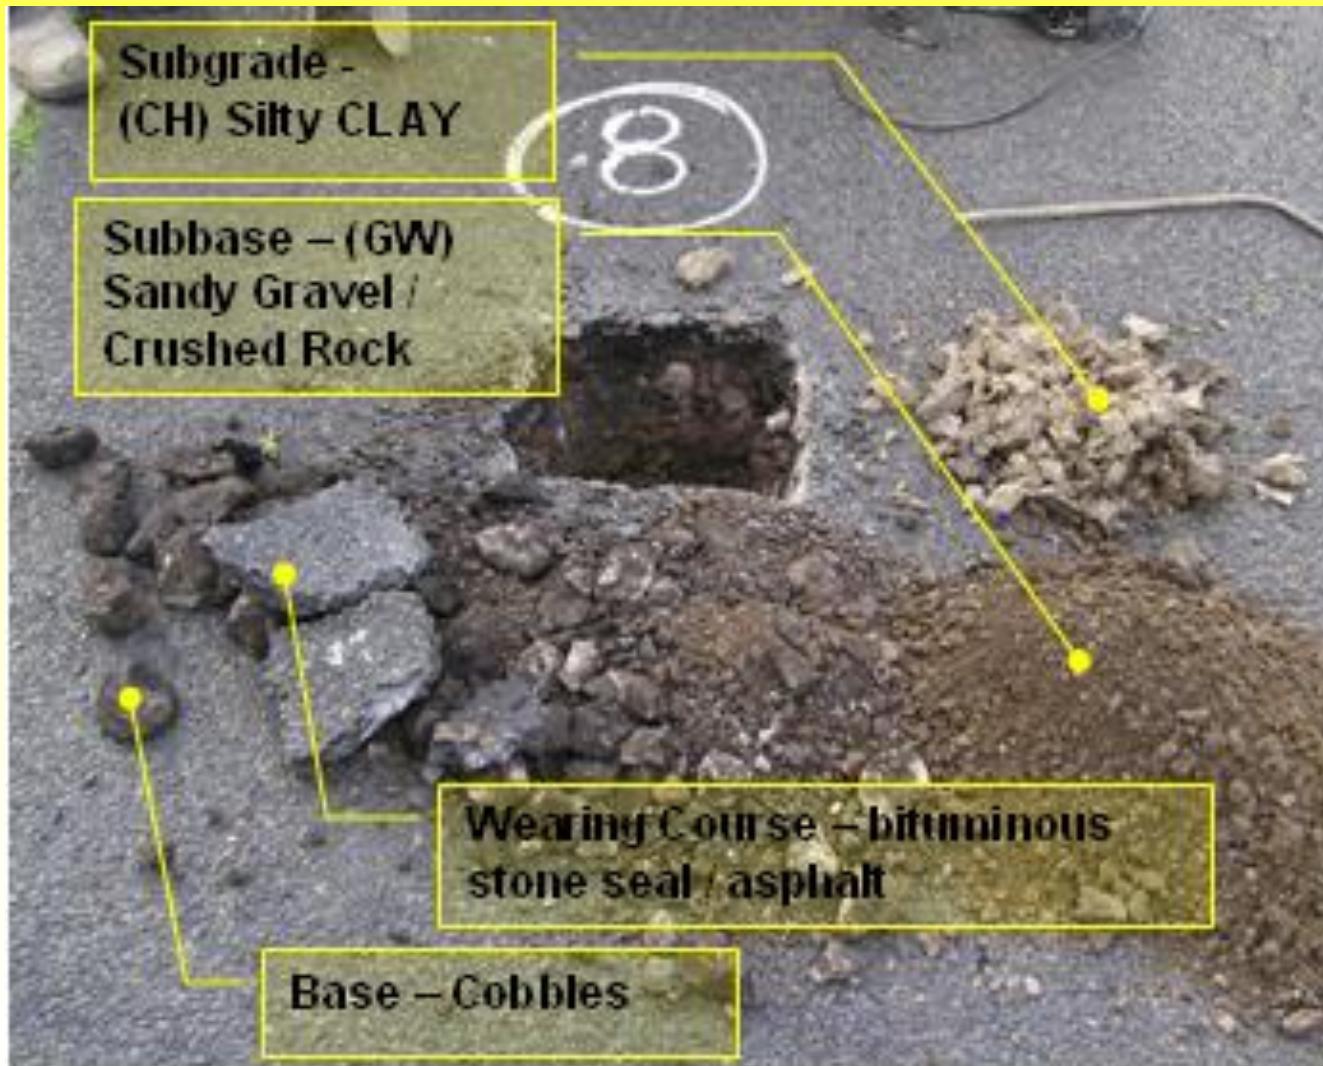

Longitudinal and Transverse cracking is likely associated with volume change of the underlying expansive subgrade, cyclical weakening and differential settlement or moisture conditions

# FIELD TESTING

| Principle Soil Type           | Descriptive Term     | Size           | Familiar Example            |
|-------------------------------|----------------------|----------------|-----------------------------|
| <b>Coarse - Grained Soils</b> | <b>Boulders</b>      | >200mm         | Football or Watermelon      |
|                               | <b>Cobbles</b>       | 200 to 63mm    | Melon or Grapefruit         |
|                               | <b>Coarse Gravel</b> | 63 to 20mm     | Mandarin or Peanut          |
|                               | <b>Medium Gravel</b> | 20 to 6mm      | Grape or Sultana            |
|                               | <b>Fine Gravel</b>   | 6 to 2.36mm    | Pea                         |
|                               | <b>Coarse Sand</b>   | 2.36 to 0.6mm  | Rock Salt                   |
|                               | <b>Medium Sand</b>   | 0.6 to 0.2mm   | Openings of a window screen |
|                               | <b>Fine Sand</b>     | 0.2 to 0.075mm | Table Salt or Sugar         |

# **FIELD TESTING**

## **(field identification)**

| <b>Group Symbol</b> | <b>Typical Names</b>  | <b>Field Identification</b>   |
|---------------------|---|---|
|                     |   |   |
| <b>GW</b>           | Well graded gravels, gravel - sand mixtures, little or no fines                       | Wide range in grain size and substantial amounts of all intermediate sizes, not enough fines to bind coarse grains, no dry strength |
| <b>GP</b>           | Poorly Graded gravels and gravel - sand mixtures, little or no fines, uniform gravels | Predominantly one size or range of sizes with some intermediate sizes missing, not enough fines to bind coarse grains               |
| <b>GM</b>           | Silty Gravels Gravel - sand-silt mixtures   | Dirty' material with excess of non-plastic fines, zero to medium dry strength   |
| <b>GC</b>           | Clayey gravels, gravel-sand-clay mixtures   | Dirty' material with excess of plastic fines, medium to high dry strength   |
| <b>SW</b>           | Well graded sands and gravelly sands; little or no fines                              | Wide range in grain size and substantial amounts of all intermediate sizes, not enough fines to bind coarse grains, no dry strength |
| <b>SP</b>           | Poorly graded sands and gravelly sands; little or no fines, uniform sands             | Predominantly one size or range of sizes with some intermediate sizes missing, not enough fines to bind coarse grains               |
| <b>SM</b>           | Silty sands, sand-silt mixtures   | Dirty' material with excess of non-plastic fines, zero to medium dry strength   |
| <b>SC</b>           | Clayey sands, sand-clay mixtures  | Dirty' material with excess of plastic fines, medium to high dry strength   |

# **FIELD TESTING**

## **(field identification)**

| Group Symbol  | Typical Names   | Field Identification                                     |
|---------------|---|--|
| <b>ML</b>     | Inorganic silt and very fine sands, rock flour, silty or clayey fine sands with slight plasticity | dry strength = none to low, toughness = none             |
| <b>CL, CI</b> | Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays | dry strength = medium to high, toughness = medium        |
| <b>OL</b>     | Organic silts and organic silty clays of low plasticity   | dry strength = low to medium, toughness = low            |
| <b>MH</b>     | Inorganic silts, micaceous or diatomaceous fine sandy or silty soils, classic silts               | dry strength = low to medium, toughness = low to medium  |
| <b>CH</b>     | Inorganic clays of high plasticity, fat clays   | dry strength = high to very high, toughness = high       |
| <b>OH</b>     | Organic clay of medium to high plasticity, organic silts  | dry strength = medium to high, toughness = low to medium |

# **SITE INVESTIGATION**

# **LABORATORY TESTING**

# **SUBGRADE EVALUATION**

# **SITE INVESTIGATION** **LABORATORY TESTING**

## **CBR (California Bearing Ratio) –**

Measurement of Subgrade Strength, usually a re-compacted sample is soaked for four days and its strength then measured under load.

## **Classification Testing (Plasticity Index, Liquid Limit, Plastic Limit, Linear Shrinkage & Sieve analysis) –**

Usually obtained to classify or categorize the soil and its properties. Can be used to assist in the assessment of material quality against specifications.

## **UCS (Unconfined Compressive Strength)**

Measurement of subgrade strength, usually a recompacted sample is compressed after 3, 7 or 28 days to confirm strength (similar test to that to check the strength of concrete), well suited for cementitious modified materials with strengths around 1MPa.

## **Density Testing (Rapid Hilt Compaction Test)**

Used for comparing in-place density and moisture against quality standards

# **SITE INVESTIGATION**

## **SUBGRADE EVALUATION**

| Description of subgrade |                    | Typical CBR values (%) |                       |
|-------------------------|--------------------|------------------------|-----------------------|
| Material                | USC classification | Well drained           | Fair to poor drainage |
| Highly plastic clay     | CH                 | 5                      | 2–3                   |
| Silt                    | ML                 | 4                      | 2                     |
| Silty clay              | CL                 | 5–6                    | 3–4                   |
| Sandy clay              | SC                 | 5–6                    | 3–4                   |
| Sand                    | SW,SP              | 10–15                  | 5–10                  |

# **SITE INVESTIGATION**

# **SUBGRADE EVALUATION**

## **Level 1 Inspection & Testing (Inspection & Supervision of Earthworks) –**

Key Aims;

Meet Project Specification Requirements

Full Time Supervision of Earthworks including Site Visit Records

Material Approval

Base and/or Working Platform Approval

Proof Rolling

Moisture Conditioning

Compaction Control / Testing

Material Strength Testing (UCS, CBR Testing, Deflection Testing)

Soil Testing for Slab & Footing Construction

Based on the inspection and testing provide validation that the site could be reclassified from class P “Problem” to a standard type ‘Class S, M, H1, H2 or E’ site in relation to slab and footing construction.

# SITE INVESTIGATION

# PERCIEVED BENEFITS AT THE HARVEY NORMAN PROJECT

**Subgrade Preparation of Working Platform**  
**Harvey Norman Homemaker Centre: 917 Princes Highway**  
**(Corner Princes Highway and Westall Road)**  
**Springvale**

26 August 2009  
Report R1462-8  
(Map Ref: 79H2)

For  
Calardu Springvale Pty Ltd  
C/- Norwood Hall Pty Ltd  
2/358 Lower Plenty Road  
Rosanna VIC 3084

- Provide a stable 'working platform' on which to operate construction equipment.
- Facilitate the provision of a uniform bearing surface under the pavement.
- Reduce deflection at joints, thus ensuring effective long-term load-transfer across joints by interlock (especially if no other load-transfer devices are provided).
- Assist in the control of excessive shrinking and swelling of expansive subgrade soils.
- Prevent 'pumping' at joints and pavement edges.

# **SITE INVESTIGATION**

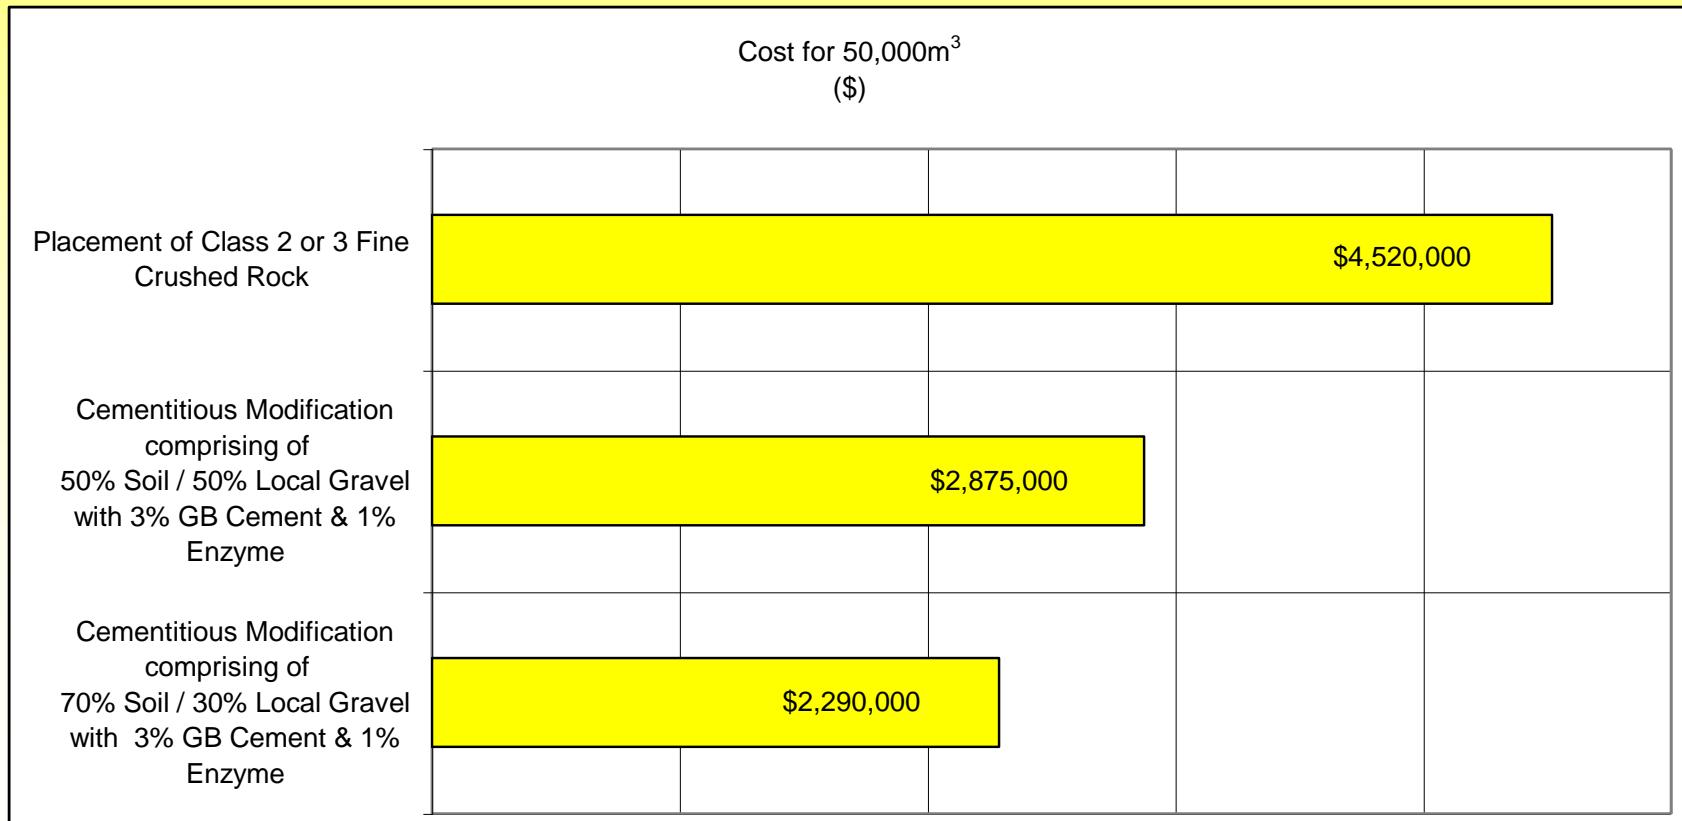

# **PERCIEVED BENEFITS AT THE HARVEY NORMAN PROJECT**

- Observations of a good working platform even after heavy rain which has allowed construction to proceed

# ESTIMATED COST BENEFITS

| Typical Example of a 50,000m <sup>2</sup> Commercial Site Requiring 1.0m depth of Crushed Rock Fill | Cost (\$/m <sup>2</sup> ) | Cost for 50,000m <sup>3</sup> (\$) | Cost Comparision with Fine Crushed Rock |
|---|---------------------------|------------------------------------|---|
| Placement of Class 2 or 3 Fine Crushed Rock   | \$90.40                   | \$4,520,000                        | 100%                                    |
| Cementitious Modification comprising of 50% Soil / 50% Local Gravel with 3% GB Cement & 1% Enzyme   | \$57.50                   | \$2,875,000                        | 64%                                     |
| Cementitious Modification comprising of 70% Soil / 30% Local Gravel with 3% GB Cement & 1% Enzyme   | \$45.80                   | \$2,290,000                        | 51%                                     |

# ESTIMATED COST OF VARIOUS TREATMENTS

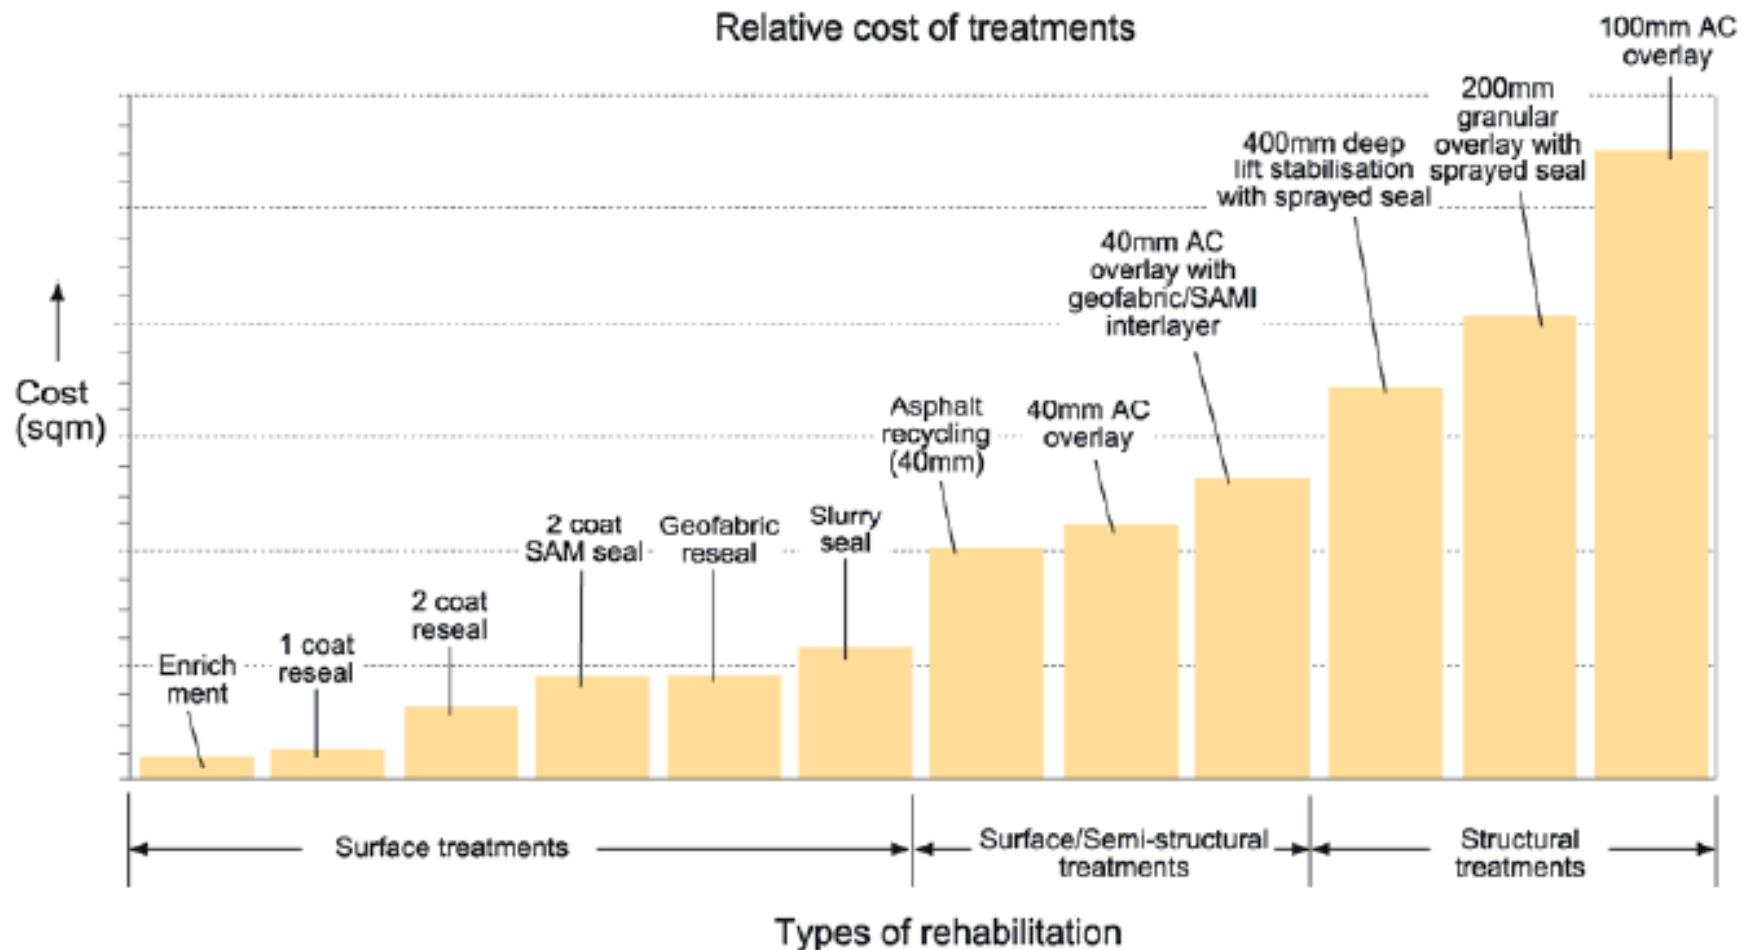

Figure F.1 : Relative Costs of Rehabilitation Treatments  
(Adapted from Ramanujam, 1998)

## **ESTIMATED COST OF VARIOUS STABILISATION TREATMENTS**

| <b>Treatment</b>                            | <b>Cost \$/m<sup>2</sup></b> |
|---|------------------------------|
| 2% GB cement (300 mm)                       | 15                           |
| Bitumen (2%), emulsion/cement (2%) (250 mm) | 18                           |
| Foamed bitumen (250 mm)                     | 22                           |
| Note : Costs are indicative only            |                              |

## SUBSURFACE DRAINAGE

### Types of Subsurface Pavement Drains

Table 6.1 Selection of Type of Subsurface Drain & Filter Type.

| Sugrade Type   | Permeability Range<br>m/sec | Type of Pavement Drain<br>(SD 1601) | Grades of Granular Backfill<br>Material |
|--|-----------------------------|-------------------------------------|---|
| Homogenous clay with very low permeability                                   | $< 10^{-9}$                 | Type 3 or Type 4                    | Sand (Grade A1 to A3)                   |
| Silty or sandy clays and stratified clays with moderately low permeability   | $10^{-9}$ to $10^{-5}$      | Type 2, Type 3 or Type 4            | Sand (Grade A4 to A6)                   |
| Clean sand or gravel with high permeability                                  | $> 10^{-5}$                 | Type 1 or Type 2                    | Aggregate (Grade B1 or B2)              |
| Solid rock or clean broken rock with high permeability or permeable fissures | Not applicable              | Type 1                              | Aggregate (Grade B3 or B4)              |

# PAVEMENT DESIGN

## SUBSURFACE DRAINAGE

Differential horizontal loading exerted by reactive soils within road reserve. Concentrated Horizontal Forces from Road Reserve soils being wet up from adjacent driveway and road reserve runoff together with soils underlying driveways remaining under equilibrium conditions (i.e. potential cause of differential movement).

Little or no vertical displacements observed within distressed areas. Likely reason due to adequate cover with low reactive subgrade improvement materials

All failures observed are in the vicinity of driveways and include kerb and channel displacement and subsequent shoving of asphalt surfacing

# PAVEMENT DESIGN

## SUBSURFACE DRAINAGE

**SITE 1 - BENEATH THE NATURE STRIP**  
The moisture content contour plot shows the subgrade is relatively moist near to the surface within the nature strip (test site 1). Moisture contents within the upper soil horizon in this area were found to range approximately between 20% to 30%. Nevertheless the plot also shows the moisture contents to be relatively drier down deep (typically ranging between 15% to 20%). This dryness is likely caused by the installation of efficient subsurface drainage and / or services acting or assisting as subsurface drainage consequently drying out the subgrade.

**SITES 2 & 3 - BENEATH THE PAVEMENT**  
The moisture content contour plot shows almost the opposite effect to moisture content (and likely subsequent ground movement) beneath the existing pavement (test sites 2 & 3) to that found within the nature strip (test site 1). Moisture contents within the upper soil horizon (beneath the pavement) were namely found to range between 13% to 21% while the lower soil horizon was found to range between 20% to 30%.

# **PAVEMENT DESIGN**

## **ENVIRONMENTAL CONSIDERATIONS**

### ***Soil Reactivity***

The expansive nature of the foundation soils can play a major role in the long term performance of pavements. A guide to the identification and qualitative classification of expansive soils is presented in Table 5.2 of Austroads (2004). Comparison of laboratory test results can be used to assist in the determination of the expansive nature of the subgrade.

| Expansive Nature | Liquid Limit  | Plasticity Index  | PI x %<0.425mm  | Potential swell (%)                                       |
|------------------|---|---|---|---|
| very high        | <input type="checkbox"/> >70 <input type="checkbox"/>   | <input type="checkbox"/> >45 <input type="checkbox"/>   | <input type="checkbox"/> >3200 <input type="checkbox"/>     | <input type="checkbox"/> >5.0 <input type="checkbox"/>    |
| high             | <input type="checkbox"/> >70 <input type="checkbox"/>   | <input type="checkbox"/> >45 <input type="checkbox"/>   | <input type="checkbox"/> 2200-3200 <input type="checkbox"/> | <input type="checkbox"/> 2.5-5.0 <input type="checkbox"/> |
| moderate         | <input type="checkbox"/> 50-70 <input type="checkbox"/> | <input type="checkbox"/> 25-45 <input type="checkbox"/> | <input type="checkbox"/> 1200-2200 <input type="checkbox"/> | <input type="checkbox"/> 0.5-2.5 <input type="checkbox"/> |
| low              | <input type="checkbox"/> <50 <input type="checkbox"/>   | <input type="checkbox"/> <25 <input type="checkbox"/>   | <input type="checkbox"/> <1200 <input type="checkbox"/>     | <input type="checkbox"/> <0.5 <input type="checkbox"/>    |

Guide to classification of expansive soils (Table 5.2 Ausroads 2004)

# **PAVEMENT DESIGN**

## **ENVIRONMENTAL CONSIDERATIONS**

### **Swell Potential**

Materials with percentage swells > 2.5% shall be considered as expansive.

For expansive materials, the potential seasonal volume changes and resulting shape loss shall be minimised by undertaking some of the following steps:

#### Provision of a Capping Layer

- Permeability  $< 5 \times 10^{-9}$  m/sec
- Swell  $< 2.5\%$
- Typical minimum thickness 150 mm
- Extension of the capping layer beyond K&C
- Preferred minimum cover 400mm
- It is preferred that Subsurface pavement drains be designed to function wholly within the capping layer.
- Appropriate Landscaping Design, planting of trees and shrubs (see VicRoads Technical Report No. 75).

Chainage Versus Deflection for Bell Street (R0062-7)

# PAVEMENT REHABILITATION

FALLING WEIGHT DEFLECTOMETER (FWD) AND PaSE VEHICLE DEFLECTION TESTING AND ASSESSMENT OF DATA FOR PAVEMENT REHABILITATION OF EXISTING ROADS

| Pavement Section  | Appropriate Treatment Options   |
|---|---|
| <b>SECTION A (Glengala Rd - Chainage 00km to 0.120km)</b>       | The characteristic curvature and deflection information indicates that an asphalt overlay thickness in the order of <b>80mm</b> is required to withstand a fatigue life greater than $6.0 \times 10^4$ ESA's. This analysis compares well with theoretical analysis undertaken through the use of Circly.   |
| <b>SECTION B (Chainage 0.120km to 0.340km - Henry St)</b>       | The existing pavement in this area was found to be in a very poor condition with extensive failures observed. The characteristic curvature and deflection information indicates that a relatively thick asphalt overlay is required. Theoretical analysis has determined that an asphalt overlay thickness in the order of <b>100+mm</b> thick would be required (without taking into consideration environmental factors related to subgrade reactivity). Given the relatively thick overlay required in this area it may be preferred that the existing pavement be reconstructed and incorporate the construction of a subgrade improvement / capping layer. |
| <b>SECTION C (Henry St - Chainage 0.340km to 0.430km - end)</b> | The characteristic curvature and deflection is less than tolerable values therefore requires <b>no structural upgrading</b> in relation to FWD data. Nevertheless it may be preferred to provide an asphalt overlay to strengthen distressed areas and remedy surface deficiencies.   |

|   |   |
|---|---|
| <p><b>Defects</b></p> <p><u>Block Cracks</u> are likely associated with ageing and hardening of the surfacing, and were observed in the vicinity of the rigid pavement, and are likely associated with reflection from underlying joints.</p> <p>Various patches were observed throughout the investigated road length and are likely associated with routine maintenance of developing defects over the years and associated upgrading.</p> <p>Meandering cracking observed is likely associated differential moisture conditions or settlement within filled areas. Some sinking and rutting was also observed within areas inferred to have been filled.</p> <p>Crocodile cracking is likely associated with a fatigued pavement, inadequate pavement thickness or material and / or a brittle or aged bitumen</p> | <p><b>Defects</b> observed within the existing pavement have predominantly included various cracking and patching upgrading works as described below:</p> <p><b>Block Cracking</b></p>  <p><b>Minor/major patching treatments</b></p>  <p><b>Meandering cracking &amp; Sinking</b></p>  <p><b>Crocodile Cracking</b></p>  |

(1) Standard Types of Dense Graded Asphalt (DG4)

# PAVEMENT COMPOSITION

## CEMENTITIOUS MODIFICATION

Modified granular material – achieved by adding small amounts of cementitious binder and / or granular material. This process is undertaken to remedy deficiencies in the granular material with modified material being considered as (improved) granular material with enhanced strength characteristics. Further laboratory testing including UCS testing should be carried out to determine the most appropriate amount and type of binder to be used. Typically UCS strengths in the order of 1.0MPa are required with higher values likely to result in reflective / shrinkage cracking, unless significant unbound granular or asphalt cover is provided.

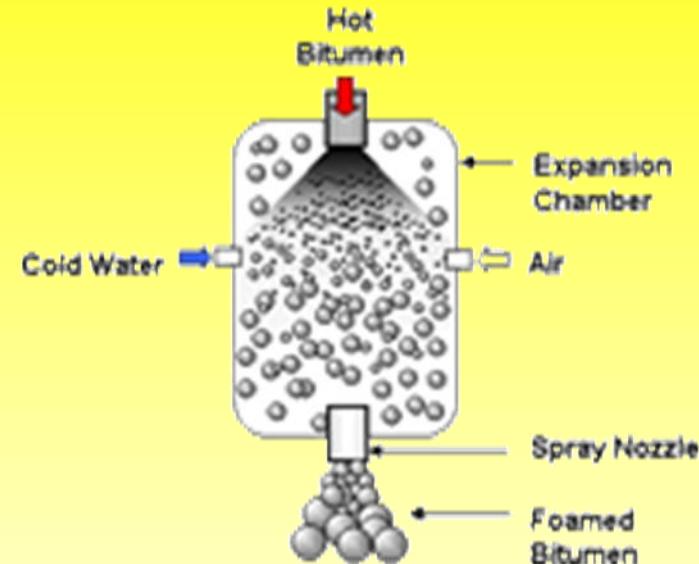

# FOAM BITUMEN STABILISATION

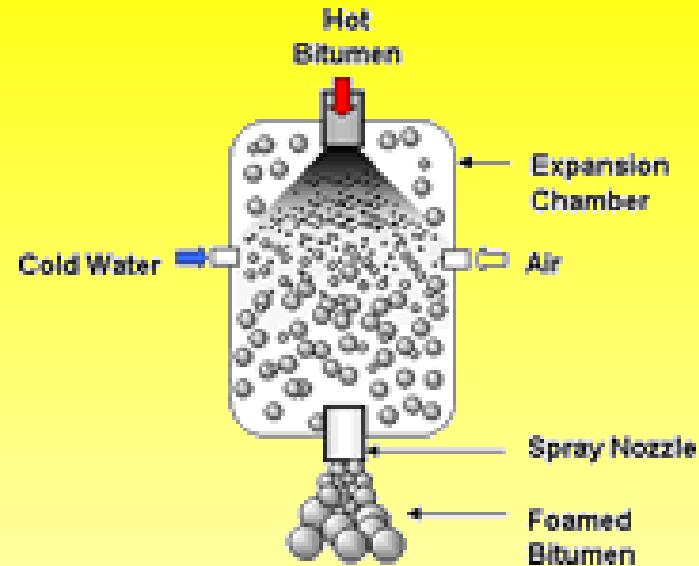

Performance of this treatment to date has been encouraging. Superior long term performance and lower maintenance is possible using the foamed bitumen stabilisation method compared to other more conventional stabilisation treatments, provided proper investigations, mix designs and quality control in construction is performed.

Foamed bitumen stabilisation can be undertaken using one of two methods:

- **Insitu mixing** — the existing pavement material is milled and the foamed bitumen and additives are mixed directly into the material without removal from site.
- **Pugmill/paver** — the existing material is milled and hauled to a central batch plant where foamed bitumen and additives are added followed by thoroughly mixing. The modified product is then hauled back to site for laying.

## FOAM BITUMEN STABILISATION

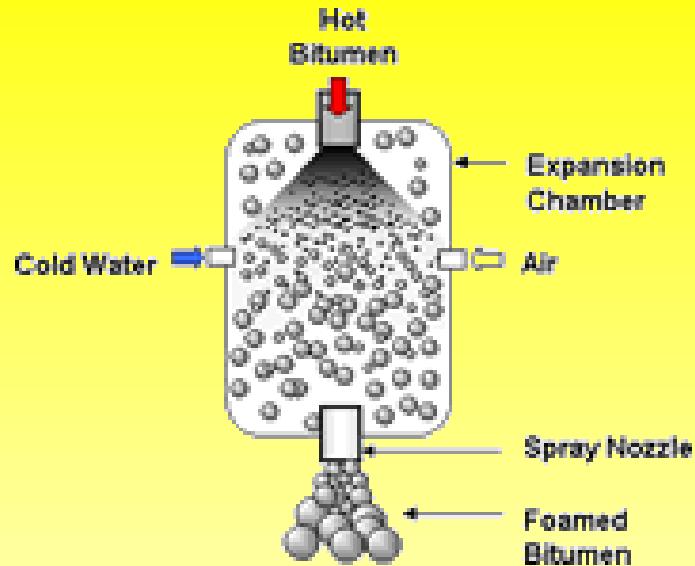

Improvement in granular material achieved by adding small amounts of bituminous binder (Usually 3% to 4% bitumen) a A foaming agent, and / or lime or cement and/or granular material. This process is undertaken to remedy deficiencies in the granular material with foam bitumen stabilised material being considered as (highly improved) granular material with enhanced strength characteristics. Further laboratory testing including modulus testing should be carried out to determine the most appropriate amount and type of binder to be used. Typically indirect tensile resilient modulus strengths in the order of 1,500MPa to 2,000MPa are required.

UCS may also be considered to be used at the same time as density testing to assist with simple daily quality control.

# PAVEMENT COMPOSITION

## FOAM BITUMEN STABILISATION

| Average daily ESAs in the design lane in the year of opening | Initial modulus <sup>1</sup> (MPa) | Minimum cured modulus <sup>3</sup> (MPa) | Minimum soaked modulus <sup>4</sup> (MPa) | Minimum retained modulus ratio <sup>5</sup> |
|--|------------------------------------|--|---|---|
| < 100  | 500                                | 2500                                     | 1500                                      | 40%   |
| 100 – 1000   | 700                                | 3000                                     | 1800                                      | 45%   |
| > 1000   | 700 <sup>2</sup>                   | 4000                                     | 2000                                      | 50%   |

<sup>1</sup> Samples initially cured at 25°C for 3 hours prior to initial modulus testing

<sup>2</sup> Recommend wheel tracker testing be completed to confirm curing time required

<sup>3</sup> Samples cured at 40°C for 3 days prior to cured modulus testing

<sup>4</sup> Cured modulus test samples conditioned in a water bath under vacuum for 10 minutes prior to testing

<sup>5</sup> Retained modulus ratio = soaked modulus / cured modulus

# **PAVEMENT COMPOSITION**

## **SUBGRADE IMPROVEMENT**

Subgrade Improvement is often required when the CBR value of the subgrade at the time of construction falls below 5%.

A relatively simple method of determining subgrade improvement requirements is to use the Japan Road Association Formula (refer Austroads, Equation 9.1)

$$CBR_m = \left[ \frac{\sum_i h_i \times CBR_i^{0.33}}{\sum_i h_i} \right]^3$$

(Austroads, Equation 9.1)

where  $CBR_i$  is the CBR value in layer thickness  $h_i$ , and  
 $\sum h_i$  is taken to a depth of 1.0m

# **PAVEMENT COMPOSITION**

## **SUBGRADE IMPROVEMENT**

Subgrade Improvement is often required when the CBR value of the subgrade at the time of construction falls below 5%.

A relatively simple method of determining subgrade improvement requirements is to use the Japan Road Association Formula (refer Austroads, Equation 9.1)

$$CBR_m = \left[ \frac{\sum_i h_i \times CBR_i^{0.33}}{\sum_i h_i} \right]^3$$

(Austroads, Equation 9.1)

where  $CBR_i$  is the CBR value in layer thickness  $h_i$ , and  
 $\sum h_i$  is taken to a depth of 1.0m
